Licensing And VDI Environments

Read&Write for Windows can be licenced within a VDI setup, such as where users hot desk or when VDI sessions are non-persistent.

There are a couple of ways to set up this up:

For a **Single User** license the license file is stored and persisted in the user settings folder (appdata folder), this will follow the user if the settings are Roaming.

For **Group/Unlimited** licences there should not be an issue for storing the license, either the license file is saved to user settings (appdata folder) or using the Multi-User Setup Tool a specific location can be selected to store this file. The other requirements here are using the Multi-User Setup Tool for rolling out the Product Code on the VM's and ability for Read&Write to see the domain for WFH users.
