Deploying AutoCorrect as part of your Read&Write Workplace License

Last Modified on Thursday, 07-Aug-2025 09:47:06 BST

AutoCorrect is now included with all Workplace Read&Write licenses.
AutoCorrect is a **separate application** and uses a **separate installer** from Read&Write (only the licensing is shared).
In order for AutoCorrect to run, Read&Write must be installed and licensed prior to deployment as AutoCorrect will activate using this licensing.

Here are instructions on how to install AutoCorrect:

1. We recommend deploying/installing AutoCorrect the same way you deployed/installed Read&Write.

2. Here are links to download AutoCorrect:

    -   MSI

    -   EXE

    -   PKG

3. Deploy your chosen installer using a method of your preference. Examples include creating a deployment script (you can create a deployment script using a text editor or a scripting language like PowerShell with basic switches like /i /qn) setting AutoCorrect as an allowed exe/installer before distributing to employees for self-service install or deploying via a packaging agent such as Intune (AutoCorrect uses standardised installer formats that should be supported in these agents out of the box).
    A full list of installation switches supported by AutoCorrect can be found here.
