

Pre-Configuring Mac for AutoCorrect Use In A Site Environment

Last Modified on Monday, 15-Jul-2024 14:42:58 BST

AutoCorrect requires a system permission to be able to work properly.

In a network environment, standard end users may not have the right permissions to enable this, so network admins will need to create and push out a mobileconfig file via MDM to give AutoCorrect these required permissions automatically.

Apple has detailed information and examples on their [support website](#).

The AutoCorrect mobileconfig file will require 1 key in the Services dictionary:

- Accessibility

The generated mobileconfig file will need to be deployed to the target machines via an MDM.

We have a [template mobileconfig file here](#) and an [example mobileconfig file here](#).

Please note:

- We cannot guarantee the example mobileconfig file will work on your systems, but it should be a good starting point.
 - The template file shows how to generate the CodeRequirement string.
 - Always make sure both PayloadUUID strings have been generated by yourself, using uuidgen.
-
