

Command-line usage (pre install) MSI deployment

Last Modified on Tuesday, 25-Feb-2025 07:29:29 GMT

Deploy any or all of the License file, the ExamWritePadSettings.json file, and/or the logo file during the MSI install as a command line property. This will mean that your provided file will be installed instead of the default one. You can use this to deploy your preferred settings to end-user machines.

Paths must be full paths, not relative ones, even for files in the same folder as the MSI file:

- GOOD: \\zserver\shared\examwritepad.json
- GOOD: Z:\shared\examwritepad.json
- BAD: examwritepad.json
- BAD: \shared\examwritepad.json

Parameters:

- LICENSEKEYFILE= *(Followed by the full path and file name of the License file)*
- SETTINGSFILE= *(Followed by the full path and file name of the Settings JSON file)*
- LOGOFILE= *(Followed by the full path and file name of the logo file you wish to use on the start-up splash screen)*

For example:

```
ExamWritePad.msi LICENSEKEYFILE="\\ServerName\ShareFolder\license.lic" SETTINGSFILE="\\Servername\ShareFolder\ExamWritePadSettings.json" /qn
```
