

Disable the automatic program update

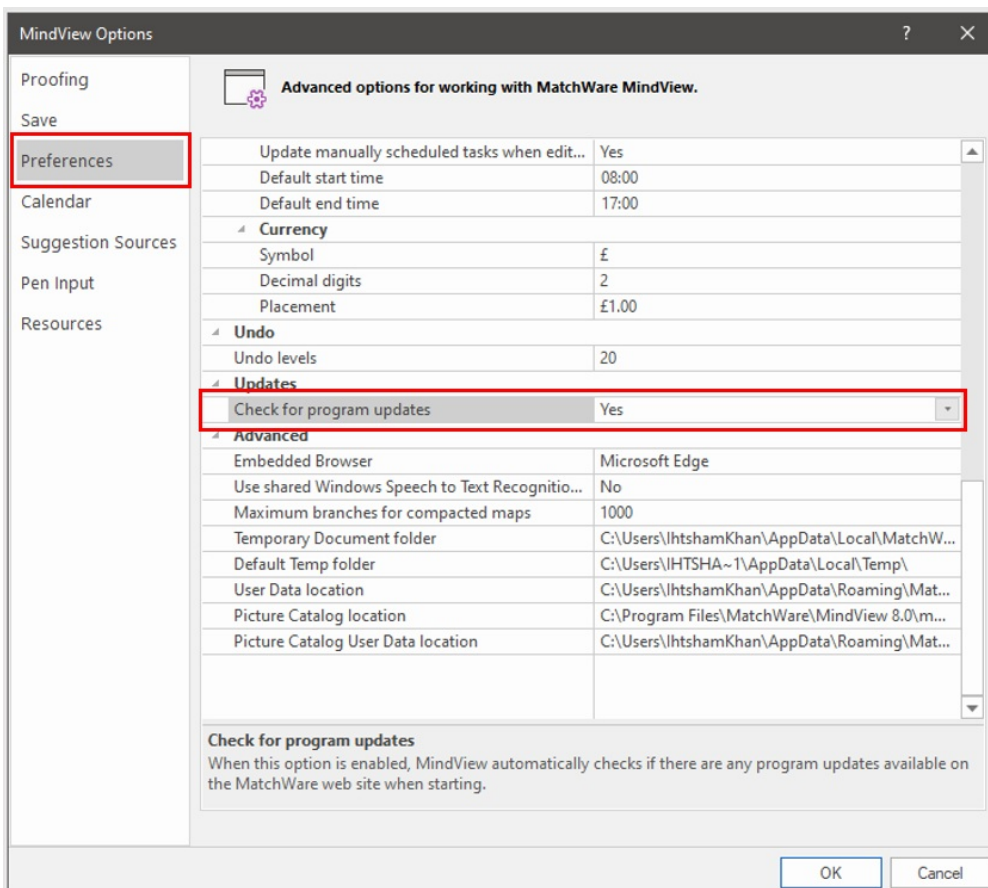

Last Modified on Friday, 12-Dec-2025 13:55:17 GMT

Get Started: Disable the Update Check

Option 1: Individual User Control

This is the perfect way for an individual user to manage their own settings and get that desired performance boost.

1. **Open MindView** and select the **File** tab.
2. Choose **Options** from the menu on the left.
3. Select **Preferences**.
4. Scroll down to the **Updates settings** section.
5. Change the “Check for program updates” value to **“No.”**

That's it! You'll now enjoy a super-fast MindView launch without the automatic check.

Option 2: Administrator-Level Control (For All Users)

For the system administrator, you have two **powerful** ways to implement this setting for everyone across

your entire organization. This ensures consistency and saves everyone time!

A. During Installation (The Easiest Way!)

When you perform an administrative install, simply set this Windows installer property:

```
ENABLEUPDATECHECK=0
```

This single step implements the change for all future users.

B. Via the Windows Registry

If MindView is already installed, you can make a quick, powerful change using the Windows Registry, which is the central database for system and application settings.

- To set this for **all users** on the machine, you can change the following setting (just make sure to replace the version number, like *MindView 9.0*, with the version you are currently using):

```
[HKEY_LOCAL_MACHINE\SOFTWARE\MatchWare\MindView 9.0\AutoUpdate]
```

```
"ProgramUpdateEnabled"=dword:00000000
```

Or you can set the registry setting below to disable the update checker for the user (replace Mindview9.0 with the used version if different) :

```
[HKEY_CURRENT_USER\SOFTWARE\MatchWare\MindView 9.0\AutoUpdate]
```

```
"ProgramUpdateEnabled"=dword:00000000
```
