

Deploying MindView to other Macs

Last Modified on Tuesday, 16-Dec-2025 14:25:47 GMT

The instructions below are addressed to organizations wanting to deploy MindView to other Macs.

Instructions:

1. Install MindView to one Mac.
2. Run MindView.
3. Enter the serial number.
4. (optional) Activate the application. (This is not necessary because all copies will be activated independently.)
5. Mount the target Mac (needs maximum access).

Then, if using script:

6. Run the script `deploy_mv9.sh` (download attached zip file) with the parameter "path to the mounted Mac" (`/Volumes/Mac2`).

`deploy_mv9` this zip file contains the `deploy_mv9.sh` script

Or, if copying manually:

6. Copy or install MindView to the remote Mac.
7. Copy the file `/Users/Shared/.mwmv9sni` from the original Mac to the same path on the target Mac.
8. On the target Mac, create a file `/Users/Shared/.mw9iactf` for example using the command `touch /Users/Shared/.mw9iactf`.

The target Macs will not ask for a license number, but will all be activated individually (in silent mode). They must have access to the Internet.
