

MindView requires activation every time it is started

Last Modified on Tuesday, 16-Dec-2025 15:26:29 GMT

This usually happens when the system needs special permission to write the activation file to your hard drive.

Once we clear this hurdle, you'll be all set for smooth, uninterrupted sessions.

Here is the quick fix to activate for good:

1. **Run as Administrator:** You can do this in one of two easy ways:
 - **The Shortcut:** Open your **Start Menu**, type **MindView**, then hold **Ctrl + Shift** and press **Enter**.
 - **The Right-Click:** Locate the MindView icon on your desktop or in your "Program Files" folder, right-click it, and select **Run as administrator**.
2. **Activate Once:** Enter your details as prompted. Because you are running with administrative rights, the software can now successfully save your activation "key" to the system.

If you are deploying this to multiple team members using a **GPO (Group Policy Object)**—which is just a tool for managing settings across many computers—simply check the "**Activate during installation**" box during the setup process. This ensures the software activates automatically using the system's own high-level permissions.

By running as an administrator just this once, you are giving the software the "green light" it needs to secure your license. From now on, MindView will launch instantly without ever asking for activation again!
